Mitigation of brownification of lake waters: Ongoing research in the Lagan River system with focus on Lake Bolmen

TINA MARTIN

Problem & causes of brownification

Problem: Brownification of lake water is a major problem for drinking water supply, biodiversity and tourism.

Causes:

- Unfavourable forest management → increase in natural organic matter (NOM)
- Drainage system (e.g. ditches in forests) → direct & fast inflow of NOM into lake
- Climate change: extreme weather events → sudden increase of NOM
- Leakage of NOM from peat bogs

Challenge

Understand the **complex hydrogeological system** of the catchment area (here: at lake Bolmen)

Understand the **flow/pathways of the NOM** (how are groundwater and surface water connected?)

What **measures** are needed to mitigate the browning?

How can stakeholder and landowner **encouraged to implement measures** (for example by land use change)?

What is ongoing?

- ***Blue Innovation*** FORMAS Preparatory project → Lagan water council and LU → application for implementation phase
- ***Blue Transition – How to make my region climate resilient***, EU Interreg project: 24 partners from 6 countries

Survey
of Sweden

FORMAS A graphic element consisting of four colored dots (blue, green, yellow, red) arranged in a diamond shape.

Interreg
North Sea

Co-funded by
the European Union

Blue Transition

Blue innovation –preparatory project

AIM: Establishing a **good communication channel** between the involved actors & **identify different surface and underground conditions** on a large scale with the help of geophysics.

- **Get in contact with stakeholder (workshops)**
- **Geophysical reconnaissance measurements**

Stakeholder workshops

WORKSHOP OM BRUNIFIERING AV SJÖVATTEN I BOLMEN OMråDET

Information

Information om
pågående
forskningsprojekt

Lär känna
varandra - För alla
berörda och
intressenter i
Bolmen området.

Presentationer

Senaste rönen - var står
forsningen i dag?

Halmstad Universitet

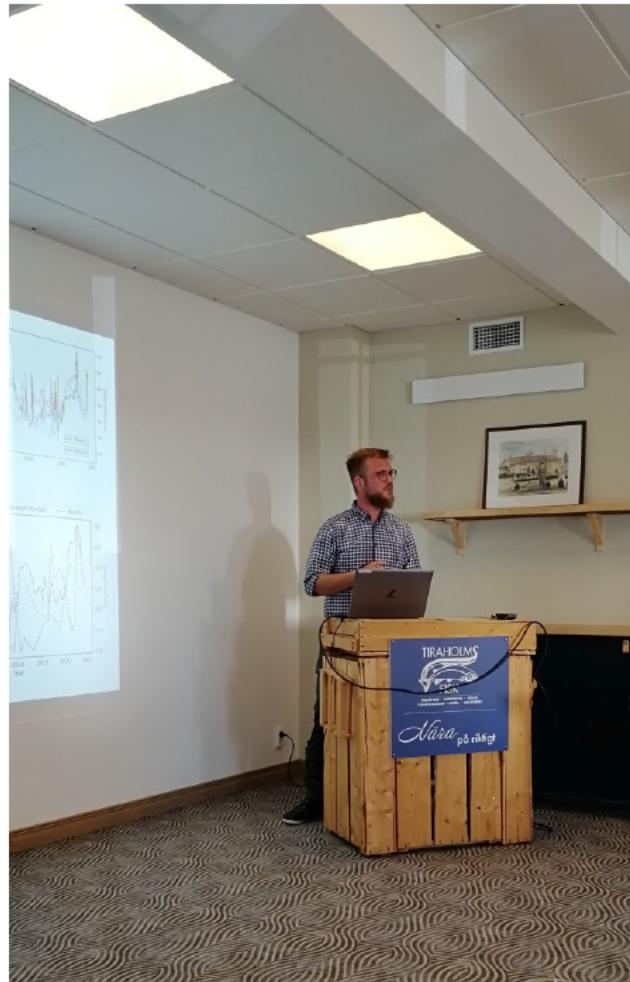

Diskussion

Effekterna och
lösningar av
brunifieringen.
Moderator: Christian
Alsterberg,
forskningsledare
Sydvatten

Agenda

12:00 - 13:00 Lunch,
Tiraholm Fisk
13:00 - 14:30
Presentationer
14:30 - 15:00 Paus
15:00 - 16:00
Diskussion

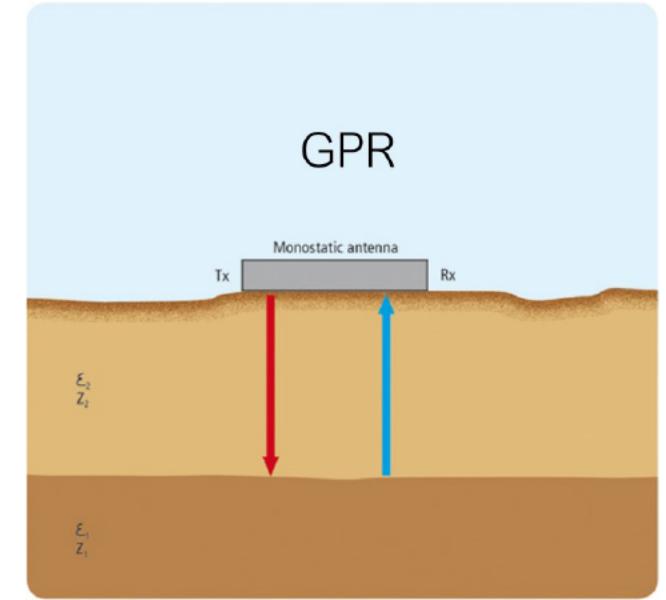

Geophysics

- Geophysics is the application of principles of **physics to study the Earth properties**
- **Different material properties:** magnetical, electrical, density,...
- Usually done (**non-destructively**) on surface but also in boreholes, air-borne, water-borne, via satellites...
- Methods here:
 - Ground penetrating radar (GPR)
 - Electrical Resistivity method (ERT) & Direct current Induced Polarisation (DCIP)

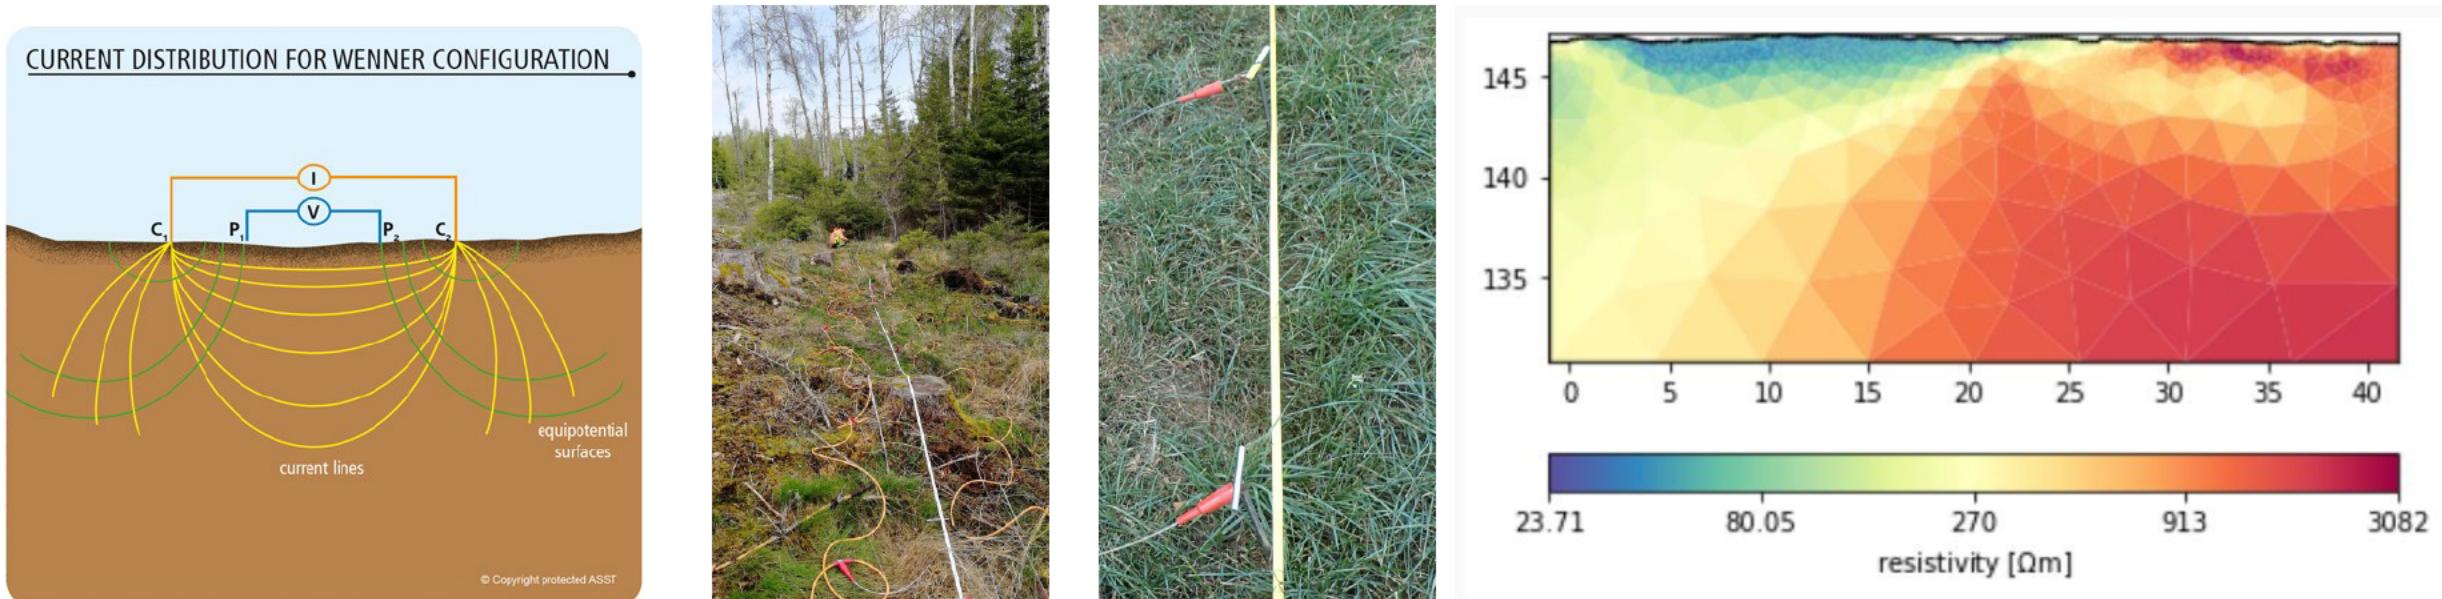

Ground penetrating radar (GPR)

- **Applications:** geological mapping (layer), engineering (cavity), archaeological investigations (buried objects), etc..
- Uses electromagnetic waves with frequencies in MHz to GHz range to detect **changes in the electrical properties**

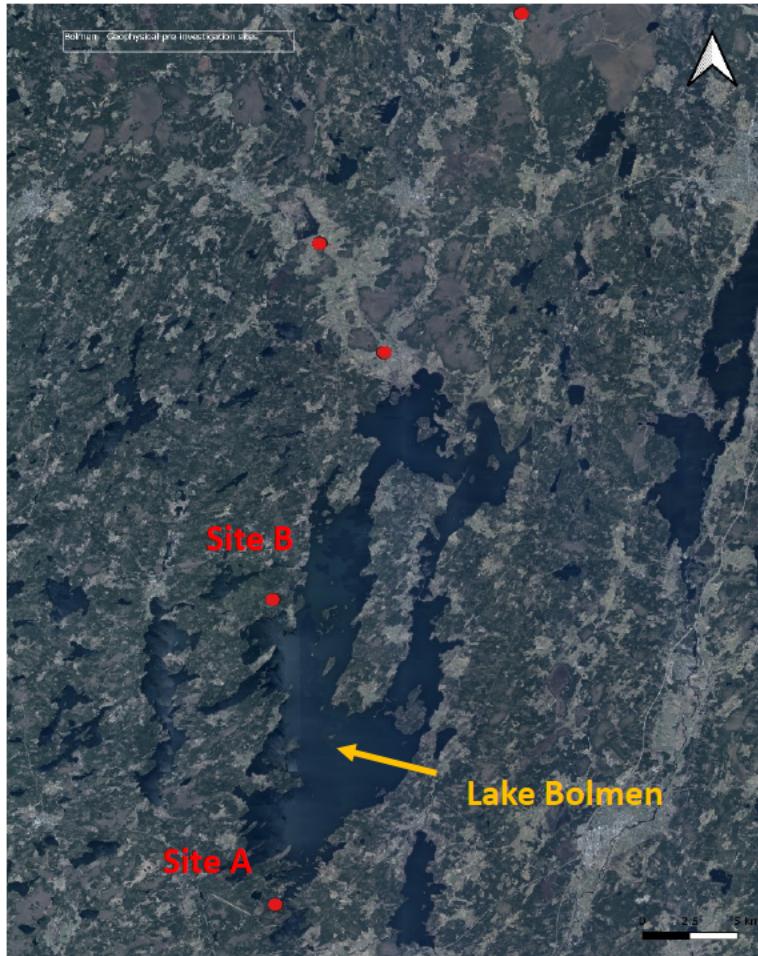

Electrical Resistivity method (ERT) & Direct current Induced Polarisation (DCIP)

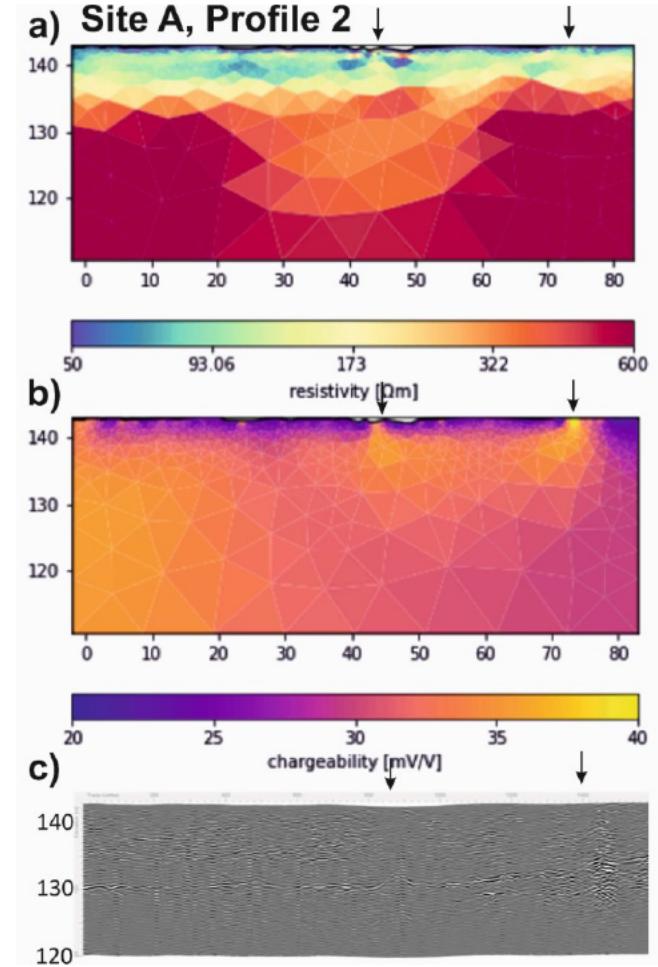

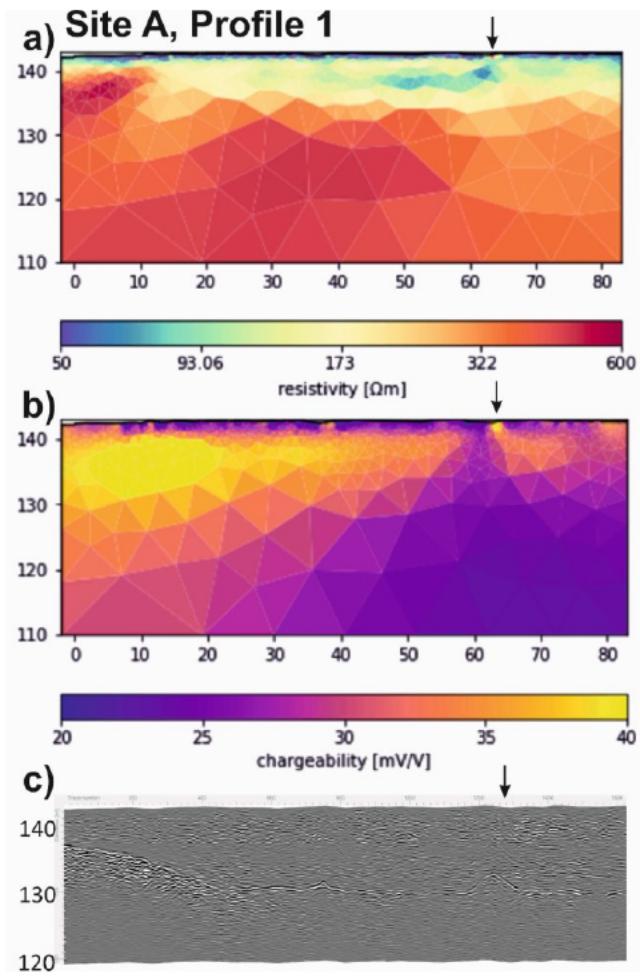

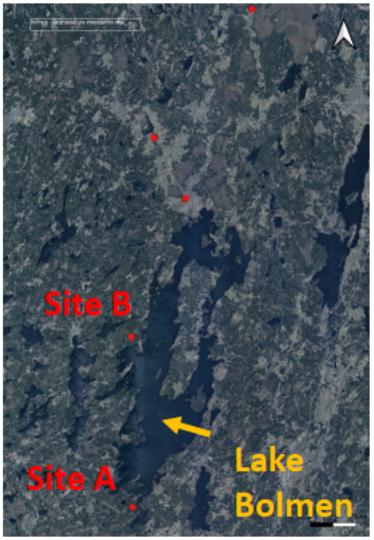

- Applications: geological mapping (layers, faults), engineering (rock properties), hydrogeophysics (gw table), mineral exploration (ores),...
- Inject current and measures the voltage potential → electrical **resistivity**
- Chargeability/Phase shift: How chargeable is the underground? Surface charge changes

Geophysical measurements

Site A

What is planned?

EU-Blue Transition: Pilot 1 - Bolmen

- Investigations of ditched areas vs natural/re-established riparian zones (monitoring)
- Hydrogeological modelling of the catchment area
- Development of different mitigation measures
- Workshops/summer schools/recommendation report
